Abstract

The invention is related to the improvement of synthetic process of N-alkyl derivative of demethylcanthridimide, that is the N-alkyl derivative of 3,6-epoxyhexahydrophthalimide which is used extensively in various insecticides and anti-spasm medicine for animals. The demethylcanthridimide and halogenated hydrocarbon are used as material which is liquid phase, anhydrous K₂CO₃ is used as solid phase. The phase-shift catalysis technology is applied in the invention.
